

DISTRICT SURVEY REPORT (DSR) OF SUNDARGARH DISTRICT, ODISHA ON RIVER SAND MINING

As per Notification No. S.O. 141(E), 15th January, 2016 & S.O. 3611(E),
25th July, 2018, New Delhi, MINISTRY OF ENVIRONMENT, FOREST &
CLIMATE CHANGE (MoEF & CC)

**DISTRICT ENVIRONMENT IMPACT
ASSESSMENT AUTHORITY (DEIAA)
SUNDARGARH, ODISHA
DECEMBER-2021**

CONTENTS

Point No.	DESCRIPTION	Page No.
00	Preface	01-02
01	Introduction	03-04
02	Overview of Mining activity in the District.	05-09
03	List of Mining leases in the district with location, area & period of validity	10
04	Details of Royalty or Revenue received in last three years.	10-11
05	Detail of Production of Sand.	12-13
06	Process of Deposition of Sediments in the rivers of the District.	14-15
07	General Profile of the District.	16-17
08	Land Utilization Pattern in the district: Forest, Agriculture, Horticulture, Mining etc.	18-22
09	Physiography of the District.	23-25
10	Rainfall: month-wise.	26
11	Geology and Mineral Wealth.	27-61

In addition to the above points, the report contains the following:

- (a) District wise details of river or stream and other sand source;
Annexure-I (Page-60)
- (b) District wise availability of sand or gravel or aggregate resources;
Annexure-II (Page-61-62)
- (c) District wise details of existing mining leases of sand and aggregates,
Annexure-III (Page-63-97)
Annexure-IV (Page-98-104)

0. PREFACE

The Erstwhile Ministry of Environment and Forests(MoEF), (the Government of India, made Environmental Clearance (EC) for mining of minerals mandatory through its Notification of 27th January, 1994 under the provisions of Environment Protection Act, 1986. Keeping in view the experience gained in environmental clearance process over a period of one decade, the Ministry came out with Environmental Impact Notification, SO 1533 (E), dated 14th September 2006. The Ministry of Environment, Forests & Climate Change (MoEF&CC), Government of India had amended the said vide notification S.O. 141(E) Dated 15th January, 2016. Now again Ministry of Environment, Forests & Climate Change (MoEF&CC), Government of India amended the notification S.O. 141(E) Dated 15th January, 2016 vide S.O. 3611(E) Dated 25th July, 2018. It has been made mandatory to obtain environmental clearance for different kinds of development projects as listed in Appendix-X of the Notification.

Further, in pursuance to the order of Hon'ble Supreme Court dated the 27th February, 2012 in I.A. No.12- 13 of 2011 in Special Leave Petition (C) No.19628-19629 of 2009, in the matter of Deepak Kumar etc. Vs. State of Haryana and Others etc., prior environmental clearance has now become mandatory for mining of minor minerals irrespective of the area of mining lease; And also in view of the Hon'ble National Green Tribunal, order dated the 13th January, 2015 in the matter regarding sand mining has directed for making a policy on environmental clearance for mining leases in cluster for minor Minerals, The Ministry of Environment, Forest and Climate Change in consultation with State governments has prepared Guidelines on Sustainable Sand Mining detailing the provisions on environmental clearance for cluster, creation of District Environment Impact Assessment Authority(DEIAA) and proper monitoring of minor mineral mining using information technology and information

technology enabled services to track the mined out material from source to destination.

The DEIAA and DEAC will scrutinize and recommend the prior environmental clearance of mining of minor minerals on the basis of District Survey Report. This will be a model and guiding document which is a compendium of available mineral resources, geographical set up, environmental and ecological set up of the district and replenishment of minerals and is based on data of various departments, published reports, journals and websites.

The District Survey Report (DSR) shall form the basis for application for environment clearance, preparation of reports and appraisal of projects. The Report will be updated every five years.

Accordingly, a survey has been carried out by the **District Level Environment Impact Assessment Authority (DEIAA), Sundargarh** with the assistance of Geology and Mining Department and involvement all other related Departments like Revenue Department, Irrigation Department, Forest Department, etc. in the district as per the *MoEF, New Delhi, notification S.O. 141(E) dated 15th January 2016* to prepare the District survey Report (DSR) of Sundargarh District (For Sand) in the year 2020. District Survey Report of Sand mining has been prepared in accordance with **Clause-I of Appendix X** of the said notification.

OBJECTIVES

The main objective of the preparation of District Survey Report is to ensure the following –

- Identification of mineral wealth in the district.
- Identification of areas of Minor Mineral having the potential mineral where mining can be allowed. And
- Identification of areas of proximity to infrastructural structures and installations where mining should be prohibited.

01. INTRODUCTION.

Sundargarh district forms the North western part of Odisha state. Sundargarh town is the district headquarter. Geographically, the district is not a compact unit and consists of widely dissimilar tracts of expansive and fairly open, dotted with tree, clad isolated peaks, vast inaccessible forests, extensive river valleys and mountainous terrain. Broadly speaking, it is an undulating tableland of different elevations broken up by rugged hill ranges and cut up by torrential hill streams and the rivers IB and Brahmani. The general slope of the District is from north to south. Because of this undulating, hilly and sloping nature of landscape, the area is subjected to rapid runoff leading not only to soil erosion but also to scarcity of water for both agriculture and drinking purposes. Brahmani, Sankh, Koel and IB are the major rivers flowing through this District. Covering a geographical area of 9712 sq.kms, Sundargarh District is the second largest District of the state, accounting for 6.23 percent of its total area. Out of this total area, forests cover 4232.57 sq km, this being the second largest in the state, accounting for 8.53 percent of the state total. Sundargarh is the southernmost district of Orissa.

Sundargarh is recognized as an industrial district in the map of Odisha. Steel Plant, Fertilizer Plant, Cement factory, Ferro Vanadium Plant, Machine building factory, Glass and china clay factory and Spinning mills are some of the major industries of this District. Sundargarh occupies a prominent position in the mineral map of Odisha and is rich in iron ore, limestone, manganese, dolomite, and fire clay. Major industries are the Odisha Cements Ltd, Hart Fertilizers Ltd, and Odisha Industries Ltd. The industrial town of Rourkela in this District has the first government sector plant built with foreign collaboration and was the first in India to use LD oxygen technology.

Still, more than 50 percent of the people earn their livelihoods from agriculture and allied sectors. Sundargarh District is coming under the

North Western Plateau Zone as per the agro climatic zone of Odisha. Soil group of the Sundargarh district is mixture of red and yellow soil. Out of the 3,13,000 hectares of cultivated land, 52 percent is upland, 30 percent is medium land and 18 percent is low land. As paddy is the main crop, 75 percent of the land is covered with paddy during Kharif. Due to limited irrigation facilities, 24 percent land is irrigated during Kharif and 8 percent of land is irrigated during Rabi.

02. OVERVIEW OF MINING ACTIVITY IN THE DISTRICT.

Other than ordinary stone & Sand a great variety of major mineral potential like Coal, Iron Ore, Manganese, Bauxite, Limestone and Specified Minor Minerals like Dolomite, Quartz, Pyroxenite & Decorative Stone (Granite) are available in the district.

As there are a major number of mines present within the district so there are two Deputy Director Mines Circles within the district i.e. DDM Koira & DDM Rourkela

The over view mining data provided by DDM Rourkela is as follows;

SI No.	List of Mines	Different of Minerals with area	Name of the lessee	Period of validity	Remarks
1	Basundhara	Coal 214.300	M/s M.C.Ltd	--	Working
2	Kulda	Coal 854.320	M/s M.C.Ltd	--	Working

06. PROCESS OF DEPOSITION OF SEDIMENTS IN THE RIVERS OF THE DISTRICT.

Fluvial Process of deposition is a geological process on the face of earth, normally controlled by various factors like gradient of the river, velocity of the flowing water, amount of discharge, change in the river channel pattern & chemical precipitation etc. Sediment in rivers gets deposited as the river slows down. Larger, heavier particles like pebbles and sand are deposited first, whilst the lighter silt and clay only settle if the water is almost still. The flow of water is strongest on the outside of river bends, eroding the bank, but is slowest on the inside of the bends, allowing deposition of sand and gravel. When a river "bursts its banks" after heavy rain, flood water spreads out across the floodplain and, because this water hardly moves, finer silt and clay are deposited – often making good farmland.

Sundargarh district is a physically hilly terrain having majorly dendritic drainage pattern to sub-parallel, there are two main rivers named IB River & *Brahmani River*. *Brahmani river* along with its tributaries, the Sankha & koel Rivers flows within the district. There are few other small rivers flows within the district. The Brahmani River originates from the vedavyas at Rourkela within Sundargarh district. The distance of the sources from the river origin is geologically very short, hence this can be concluded that the rate of deposition of sand in the above River is moderate, while in rest small rivers within the district the rate of deposit is slow.

Sundargarh district is physiologically a complex terrain having numerous numbers of hills, moulds, plane lands, river beds, agricultural lands, forest growth areas etc. In the central part of the district there is Mandira Reservoir catchment area. Adjacent to reservoir catchment area hilly terrain present which have an elevation range from mean sea level about 200m to 600m. Hills and mounts are more common in the east to Sundargarh district where as in the west part there are less hills compered to east part. There are several seasonal nala / dry nala & a

few perineal natural drainage exists within the district. Main river that flows in the district is *Brahmani River* & *Ib River*, in addition to that a few other small rivers present within the district namely *Sankha*, *Koel*, *Deo*, *River etc.* The distance of the sources from the river origin is geologically very short, hence this can be concluded that the rate of deposition of sand in *Brahmani* & *Ib River* is moderate, while in rest rivers within the district the rate of deposit is slow

***Additional river source details are given in the following tables
Please refer (Table No. 11.A.01) & (Table No. 11.B.01)***

07. GENERAL PROFILE OF THE DISTRICT.

Sundargarh District was constituted on the 1st January, 1948, out of the two ex-States of Gangpur and Bonai, which merged with Odisha on that day. True to its name, this beautiful District of Sundargarh with about 43 percent of its total area under forest cover and numerous colourful tribes dotting its landscape and with abundant mining potential is bounded by Ranchi District of Jharkhand on the North, Raigarh District of Chhatisgarh on the west and North West, Jharsuguda, Sambalpur and Angul Districts of Odisha on the South and South East and Singhbhum District of Jharkhand and Keonjhar District of Odisha on the east.

Sundargarh is recognized as an industrial district in the map of Odisha. Steel Plant, Fertilizer Plant, Cement factory, Ferro Vanadium Plant, Machine building factory, Glass and china clay factory and Spinning mills are some of the major industries of this District. Sundargarh occupies a prominent position in the mineral map of Odisha and is rich in iron ore, limestone, manganese, dolomite, and fire clay. Major industries are the Odisha Cements Ltd, Hart Fertilizers Ltd, and Odisha Industries Ltd.

Sundargarh District has 3 sub divisions, 16 Tehsils, 17 Blocks and 262 Gram panchayats. Topographically, this district is located between latitude 21 degree 36' N to 22 degree 32' N and longitude 83 degree 32' E to 85 degree 22' E. The population of this District is 2,080,664, this being the fifth most populous District of the state. Its rural population exceeds twelve lakhs and the urban population is more than six lakhs. The male literacy rate is 82.13 and female literacy rate in the District is 65.93.

The climate of this District is characterized by extremely hot summers and cool winters. Climate is hot & moist sub humid. Normal rainfall of the District is approximately 1230 mm, but there is a deviation in receipt of rainfall pattern which is influencing crop production.

The education circle of Sundargarh revenue District was bifurcated from Sundargarh to Sambalpur education circle and came to existence since 1968 with area of operation within the geographical territory of Sundargarh revenue District. There are several educational institutions in

Sundargarh District. National Institute of Technology NIT at Rourkela, Government college Rourkela, S.G. Women's College Rourkela etc are prominent among them.

Sundargarh District celebrates many festivals around the year. Important festivals of the District are Nuakhai, Rath Yatra, Ramanavami and Nama Sankirtana. Nama Sankirtana is a form of worshipping Lord Krishna and Lord Rama in a gathering.

Sundargarh District is one of the tourist attraction spots of Odisha. The District is visited by a large number of tourists round the year. Places like Rourkela, Vedavyasa, Manikmonda, Mandindra dam, Ghogar, Khandadhar and Darjeeng are the important tourist spots of the district.

08. LAND UTILIZATION PATTERN IN THE DISTRICT: FOREST, AGRICULTURE, HORTICULTURE, MINING ETC.

The best cultivated lands of Sundargarh are located along the valleys of the two main rivers, the Bramhani and IB and their tributaries viz., the Sankha the Koel, the Safai, the Ichha etc. The cultivable area of the district is 6,72,000 hect., out of which percentage of land under highland, medium land and low land are respectively 0%, 27.7% and 22.3%. As in 2011, the net area sown in the district was 3,32,056 hect., which constitute 49.4% of the gross cultivable area. The land use pattern of the district out of the surveyed area of 715280 hect. and 715256 hect. In 2009-10 and 2010-11 respectively, is given in the following table. The detailed Block and ULB-wise land use pattern is elaborated in TABLE.

Year	2009-10		2010-11	
	Area in Ha	% of surveyed area	Area in Ha	% of surveyed area
Forest	176151	24.63	152013	21.25
Land put to non-agriculture use	67568	9.45	72033	10.07
Barren and non-cultivable land	60788	8.50	63222	8.84
Permanent pastures and other grazing land	35324	4.94	34230	4.79
Land under Misc. tree crop & grooves, not included in net area sown	1484	0.21	2206	0.31
Cultivable waste	40313	5.64	45154	6.31
Old fallows	48007	6.71	54575	7.63
Current fallows	64937	9.08	61549	8.61
Net area sown	220708	30.86	230274	31.19

Forest:

There are three forest divisions in the district namely, Sundargarh Forest Division, Rourkela Forest Division, Bonai Forest Division.

As per the data provided by the **Divisional Forest Officer Cum Wild Life Warden, Rourkela** Forest Division; the land use in the division is as follows

forest area cover (1) Proposed Revenue Forest U/s-4 OFA, 1972=2143.199 ha. (14 nos), (2) Demarcated Protected Forest=3919.42 (38 nos), (3) Un Demarcated Protected Forests=15929.713 ha (269 nos), (4) Village Forest=229.176 ha (35 nos),(5) Un-Classed Forest=29.869 ha Total Forest Area in Rourkela Forest Division 22251.377 ha.

Out of 22251.377 ha, an area of **157.108** ha of forest land has been diverted for non-forestry purpose. The detail of diverted forest land is furnished below.

Sl No	Purpose for diversion	Forest Area diverted in ha.	No. of Project in Nos
1	2	3	4
1	Industry	24.34	1
2	Transmission	28.801	3
3	Road	77.796	3
4	Water Supply	1.25	1
5	Railway	17.87	1
6	Pipeline	7.051	1
	Total:	157.108	10

As per the data provided by the **Divisional Forest Officer, Sundergarh** Forest Division; the land use in the division is as follows

Forest Division the forest area cover (1) 94 nos. of Revenue Forest Blocks=101186.87 ha (2) 26 nos. of Proposed Revenue Forest U/s-4 OFA, 1972=5580.80 ha. (3) 92 nos. of Demarcated Protected Forest=14876.84 ha.(4) Un Demarcated Protected Forests=45342.23 ha. (5) Village Forest 146 nos. =1048.10 ha,(6) Un-Classed Forest= 80.43 ha (7) Land having Forest growth=3939.15 ha. Total Forest Area in Sundargarh Forest Division =172054.42 ha.

Out of 172054.42 ha, an area of **2225.0015** ha of forest land has been diverted for non-forestry purpose. The detail of diverted forest land is furnished below.

SI No	Purpose for diversion	Forest Area diverted in ha.	No. of Project in Nos
1	2	3	4
1	Mining	1264.943 ha.	9 nos.
2	Transmission	543.6799 ha.	18 nos.
3	Road Project	85.987 ha.	3 nos.
4	Railway Project	270.642 ha.	5 nos.
5	Irrigation Project	21.92 ha.	2 nos.
6	Other	37.84 ha.	4 nos.
	Total	1954.37 ha.	41 nos.

Against the total diverted land 2980.171 acers has been identified for raising Compensatory Afforestation.

As per the data provided by the **Divisional Forest Officer, Bonai** Forest Division; the land use in the division is as follows;

Total 203268.864 ha of forest area cover in Bonai Forest Division, Details of Category-wise forest area cover in this division is furnished below;

SI No	Category of forest	Number	Area(ha)
1	RF(Reserve forest)	45	102894.567
2	PRF(Proposed Reserve forest)	41	34105.896
3	VF(Village forest)	32	166.790
4	UDPF(Un-demarcated Protected forest)	406	37291.831
5	DLC land	-	22331.549
6	Un-classed forest	-	61.731
7	DPF(Demarcated demarcated protected forest)	25	5849.793
8	PF(U/s-33)(Protected forest)	27	566.707
	Total forest area	-	203268.864

Out of 203268.864 Ha. Total forest area, 6996.398Ha. of forest land has been diverted for no-forestry purpose. The details of diverted forest land is as furnished below;

Sl no	Purpose of diversion	Total(ha)	Number of project
1	Mining	6441.759	49
2	Industries	0.817	2
3	Irrigation	386.799	3
4	Road	91.144	2
5	Electric	47.346	1
6	Exploration drilling	0.000023	1
7	diverted under Forest Right Act, 2006 below 1ha.	28.533	67
		6996.398	125

Against the total diversion area, 5523.833 ha. Of land (degraded forest land-4357.699ha.+ non-forest land -1166.134ha.) has been identified for the purpose of compensatory afforestation in Bonai forest division.

Agriculture:

Land utilization pattern in the district as per the department of agriculture Sundargarh is as follows;

SL NO.	Name of the ADO Circle	Geographical Area	Forest Area	Cultivated area				Paddy Area				Non Paddy Area	Total	Crop achievement	
				High	Medium	Low	Total	High	Medium	Low	Total			Kharif (in Ha.)	Rabi (in Ha.)
1	ADO, Lephripur	18226	94419	28595	15894	8260	52749	13892	15894	8260	38046	14703	52749	51984	13901.8
2	ADO, Sundargarh	176892	95523	23887	16506	13808	54201	8825	16506	13808	39139	15062	54201	53267	15528
3	ADO, Rajgangpur	102443	14731	30459	15098	9055	54612	10929	15098	9055	35082	19530	54612	53924	19062.4
4	ADO, Panposh	194024	46918	49693	22358	12007	84058	30383	22358	12007	64748	19310	84058	84058	30143
5	ADO, Bonai	315659	186569	30366	25144	11870	67380	11971	25144	11870	48985	18395	67380	61080	19926
	Total:	971244	438160	163000	95000	55000	313000	76000	95000	55000	226000	87000	313000	304313	98561.2

The agricultural activity is by and large confined to the traditional Kharif cultivation due to lack of adequate irrigation system.

Horticulture:

Land utilisation pattern in the district as per the horticulture department Sundergarh is as follows;

LAND UTILISATION PATTERN IN SUNDERGARH DISTRICT(Area in Ha.)				
Kharif	YEAR			
	2016	2017	2018	2019
Vegetables	12460	13390	18765	13500
Spices	3900	4121	4320	4510
Fruit	16300	17406	17850	19708
Rabi				
Vegetables	30974	26476	24612	36090
Spices	5429	5600	7124	5853

Mining:

Incidence of major mineral resources is quite encouraging in the district. Leaving aside the above major minerals, some Specified Minor Minerals like Quartz, Talc/ soap stone, Decorative stones are also available in certain areas of the District. Besides, the district is rich in minor minerals like river sand, road metals, morrum, laterite stone etc.

The total area considered for mining activity for all minerals shall be the mining area within the district.

Major mineral areal details are given in the over view of mining activities chapter.

Total Area for considered for Sand mining shall be sum of lease area of sand quarry. Total Area for considered for Stone mining shall be sum of lease area of stone quarry.

09. PHYSIOGRAPHY OF THE DISTRICT.

Being the part of the Chhota- Nagpur Plateau, major parts of the district has rough and hilly terrain and rich in mineral resources as well. Hills of Sundargarh district may be classified in to three broad categories, Bonai hills, Sundargarh hills, Biramitrapur hills. The Bonai hills which further elongate into the Keonjhar district are known for their iron ore resources, whereas Sundargarh hills famous for coal deposits, which further elongate into Jharsuguda district and Chhatisgarh state as well.

The hills are mainly extensions of the Deccan and Chhota-Nagpur Plateau. In Sundargarh and Panposh Sub-Divisions there are mainly three hill ranges apart from a few isolated outcrops. The one, in the reserved forest blocks of Mahabir Chhatam, Topkurlu, Bhaismunda and Chirobeda on the South-East forming the boundary between Sambalpur and this district, runs East-West direction. The second, in the centres starts from Gurabasa reserved forest in South-West to North-East direction and runs through Kumbahal, Runga, Peruabhadi, Panchara and Brahmani reserved forest ending near the Sankha River. The third, on the western border of the district running South-East to the North-West direction is an extension of the wide range of hills forming the watershed between the river Mahanadi and her affluent IB. Thus these mountain ranges seem to have started from a point in the middle of the southern boundary of the district and outflanking in three different directions divide the country into separate plains.

The Hemgir plateau is flanked by a system of mountain which starts from Garjanjore (1966' or 599m.) and runs due South-East up to Bendrichuan (1343' or 409m.). There is an abrupt swing near the latter due West up to the water parting between the Garjhor and the Jhulenbar after which there is again a gentle bend due North-West up to the border of Raigarh district.

Among the ridges mention may be made of the great ridge, an extension of the Karampada range of Singhbhum , which apparently

seems to be the spine of the Toda area in East Bonai. It extends from North-East to South-West and is capped with an immense deposit of high grade hematite. The Rontha plateau (2500'-3000' or 762-914m) from which descends Khandadhar water fall is also covered with iron ore. The Bichakhani hill yields millions of tones of iron ore which feed the Rourkela steel plant. A new railway line has been laid to the foot of the hill at Dumaro for transportation of the iron ore.

The territory covered by Sundargarh and Panposh Sub-Divisions (comprising the ex-State of Gangpur) consists of a long undulating table-land about 700ft. (213) above the sea level dotted with hill ranges and isolated peaks of considerable height. On the West of Sundargarh Sub-Division lies the Hemgir Plateau, nearly 1150 ft (351m) high, in the centre of which is located the village Hemgir. To the North of Hemgir the land is considerably hilly while to the South it is relatively plain with a minimum elevation of 709 ft (516m) near the Chuanbahal village. The eastern tract of the Sub-Division intervening between Chota Nagpur plateau and Mahavir range, for the most part, is open and well cultivated, the general elevation of which varies from 700' to 1000' (213m TO 305m) but that of the reserved forests except, of course, a few patches, comes under 1000' to 1500' (305m to 457m). Besides, numerous isolated hills and sharp ranges running generally East to West are also evenly distributed throughout the country. On the North the Chota Nagpur plateau with its foot-hills gradually falls away to the plain while the Mahavir range in the South, springs abruptly in an irregularly wall of tilted and disrupted rock and forms for some length the boundary between Sambalpur and this district. On the southern border, dense forests linking up with the forest-clad ranges of Bonai Sub-Division are also seen. Didhrapahar, the highest peak 2509' (765m) of Sundargarh Sub-Divisiion is located near the tri-junction of Sundargarh Sub-Division , Bonai Sub-Division and Sambalpur district.

The block to the North formed by the broad valleys of the Sankh, the South Koel and the Deo, although interspersed with isolated hills and series of small ridges striking East and West, is generally plain, but the tract to the South is comparatively more hilly and wooded excepting the valley of the Brahmani which extends to an appreciable distance South of Panposh. The region extending from South of Bisra to South of Chirobeda is much broken and hilly, it raises along the Singhbhum and Bonai boundaries to an elevation of 1800' to 2000' (549m) to (610M) the highest peak being Bhaisamunda Pahar 2234' (681m). In the plains the elevation is about 600' to 700' (183m to 213m) the lowest point on the Brahmani vally on the Bonai border near Banki village being 575' (175m). The land is completely denuded of its fertility and is unsuitable for cultivation.

The principal peaks are Mankarnacha (3664ft or 1117m) and Badamgarh (3525ft or 1074m), both on Keonjhar boundary, Kumritar (3495ft or 1065m), the Bichakani (2964ft or 903m), and Khandadhar (3000ft or 914m), all in Bonai Police Station, Rengalbera (2179ft or 664m) in Banki Police Station, Baghbindha (2650ft or 808m), Raipiri (2620ft or 799m) and the Kantamunda (2524ft or 769m), all in Gurundia Police Station, Chelliakota (3331ft to 1015m), in Mahulpada Police Station, Balia (3313ft or 1010m) and the Karaspani (2483ft or 757m), both in Koira Police Station. All the above peaks are in Bonai Sub-Division, Besides, some unnamed peaks of considerable heights are also found. No hills of any significant height are found in Panposh Sub-Division. Among the peaks in Sundargarh Sub-Division mention may be made of Man (1935ft or 590m) on the Madya Pradesh border, Satparlia (1327ft or 404m) and Jogijogan (1471ft or 448m), both in Sundargarh Police Station, Mahabir (1861ft or 567m) in Bargaon Police Station, Didra (2509ft to 765m) in Rajgangpur Police Station on the trijunction of Bonai and Sundargarh Sub-Divisions and Sambalpur district. Other peaks on the Didra range are Bhaisamunda (2234ft or 681m) and Kichimir (2050ft or 625m). The last named peak is also in the Rajgangpur Police Station. Andiabira (1455ft or 443m) and Bilpahari (1333ft or 406m) are among the less prominent peaks.

10. RAINFALL: MONTH-WISE.

The district enjoys sub-tropical climate characterized by hot and dry summer, cold winter and erratic rainfall in monsoon. The winter season extends from November to end of February, which is followed by summer season from March to the middle of June, and rainy season from middle of June to middle of October. During summer months the maximum temperature rises up to 43° C and May is the hottest month. December is the coldest month of the year when the average daily temperature drops down to 8° C. Relative humidity is around 60-70% throughout the year. The highest and lowest monthly mean relative humidity so far recorded is 97% (Dec) and 26% (April).

The District Rainfall in milli-meters (R/F) shown below are the arithmetic averages of Rainfall of Stations under the District.

Month	Year wise rainfall in mm			
	2016	2017	2018	2019
Jan	6.02	3.32	Nil	8.45
Feb	18.56	Nil	0.74	38.82
Mar	11.62	0.41	1.16	28.82

11. GEOLOGY AND MINERAL WEALTH.

GEOLOGY-

Sundargarh District is part of Gangpur Group, South Singhbhum Granite-Iron Ore Series as per the studies done by several Geologists namely J. A. Dunn, Sarkar & Saha, M.S. Krishnan etc at different times.

Part of sundargarh district under reference represents a part of the Archean complex with deformed meta sediments belonging to the Biramitrapur limestone and dolomite belt in Gangpur group of Precambrian age. The litho units encountered in the area includes Quartzite, Quartz-mica-schist, slates and phyllite, limestone and dolomite, Gondite and Epidiorite, Quartz veins traversing the Gangpur group of rocks represent a phase of later geological activity. Laterites which are commonly seen in the area have been resulted from a process of residual weathering. These group of rocks are separated from the quartzite and quartz schists of the iron ore group by the persistent zone of crushed quartzite and conglomerate (Raghunath Palli Conglomerate) to the south.

To the west of the Singhbhum district, in Gangpur (now called as Sundargarh), there is an anticlinorium or geanticline which has an ENE-WSW axial direction. The structure is closed towards the east but is cut up and obscured by granitic intrusive to the west. The strike becomes WNW-ESE in eastern Gangpur, in conformity with and influenced by the structural trends of the Mahanadi & Brahmani valleys just to the south and southwest of this region.

The anti-clinorium shows the following succession of rocks, as worked out by Krishnan and named by him Gangpur Series.

Iron-ore Series (?)	Phyllites, Slates and Lavas
	Raghunathpali Conglomerate
-----Shear zone-----	
Gangpur Series	Phellytes and Mica –schists
	Upper Carbonaceous Phyllites
	Calcitic Marbles
	Dolomitic Marbles
	Mica-schist and Phyllites
	Lower Carbonaceous Quartzites and Phyllites
	Gondites with associated Phyllites
	Base not seen

Regional Structural Set-up- There is a general increase in the grade of metamorphism when the rocks are followed from the Singhbhum boarder on the east to the centre of the anti-clinorium on the west. It should, how ever, be noted that some of the rocks , which have phyllitic appearance and characters, are really products of retrogressive metamorphism, containing relics of garnet, stourolite, biotite etc. The Satpura strike (ENE-WSW) is found to be superimposed on an earlier , presumably Eastern Ghats, strike which is prominent.

Several large scale and many minor scale faults occurs in the area. Most of them are the block fault type.

The oldest rocks are Gondites found in the central or axial region of the anticlinorium. They contains, besides quartz-spesartite rocks, also those

with rhodonite, blandfordite, winchite etc., associated with workable bodies of manganese ore. They are succeeded by carbonaceous quartzite and phyllites, dolomitic and calcitic marbles and carbonaceous phyllites, these being intercalated with phyllites and mica-schists. The carbonaceous phyllites are flaggy slaty in certain places while the marbles contains very large reserve of good limestone & dolomite which are now being used as fluxes in the iron-smelting furnaces of Odisha, Bengal, Jharkhand & Bihar. Large quantities of the limestones also burnt in to Quick-lime well known in the Calcutta market as Bisra lime, named after Bisra railway station near the Singhbhum-gangpur boarder. At the top of the succession is a shear zone in which the Raghunathpali Conglomerate is involved. It is a sedimentary conglomerate which has suffered intense shearing as a result of which an autoclastic character has been imposed in it. The over lying beds are phyllites and mica-schists belonging to some parts of the Iron ore Series. The Gangpur Series is intruded by basic sills(Dalma traps) and by the bosses of the Chhota Nagpur granite. The basic rocks have been converted in to schistose, amphibolites and epidiorites containing amphibole, clinozoisite and magnetite.

Radiometric age dating of biotite etc from three different horizons in the Gangpur Series has given ages of 910 MY to 990 MY indicating that the rocks were folded and metamorphosed at the time of folding of the rocks north of the Copper Belt and the intrusion of Chhota Nagpur granite gneiss. This needs confirmation by future work.

J. A. Dunn remapped parts of the Iron-ore Series of South Singhbhum and re-interpreted the succession. He thought that the older metamorphosed by the SINGHBHUM GRANITE. The conglomerates and sandstones south of Chaibasa were assigned to the lower part of the KOLHAN SERIES, which include also limestone and shales. These limestones are worked near Chaibasa for cement manufacture. This

series lies partly on the Singhbhum Granite, but is much younger than the iron-ore Series

Based on the presently available knowledge, the succession in Singhbhum will be as follows :

Newer dolerite

Soda granite and Cu-U mineralization

Chota Nagpur Granite-Gneiss

Dhanjori Orogeny (Singhbhum Orogeny of Sarkar and Saha)

Dalma and Dhanjori lavas

Dhanjori Stage (Kolhan Series)

Singhbhum Singhbhum granite

Orogeny (Iron-ore Orogeny Sarkar and Saha)

Iron-ore Series

The geology of the area north of the Singhbhum thrust zone and east of the large Singhbhum granite exposure has been described by Sarkar and Saha(1962) and Iyengar and Alwar(1965). According to the latter authors, a geosyncline developed to the north and east of the Singhbhum granite craton, in the Dhanjori and Dalma areas. The Basal quartzite-conglomerates in this basin are followed by black carbonaceous phyllites and turbidite sequence which is overlain and intercalated with submarine volcanic flows and tuffs. Marginal features in the Mayurbhanj and Dhanjori areas were intruded by gabbro-anorthosites accompanied by vanadiferous magnetite lenses and pyroxene-granulite granophyre. A quartzite conglomerate horizon occurs above the carbonaceous phyllites. This geosyncline was subjected to folding and intrusion of granites, viz., the ROMAPAHARI GRANITE in Mayurbhanj, the CHAKRADHARPUR GRANITE IN Ghatsila region and the Soda-Granite in the Singhbhum shear zone. The Dhanjori geosyncline contains some 9,000 m of sediments but the thickness is

about 4,500 m to the north of the shear zone. The cratonic region also experienced intrusion of ultrabasic lenses and dykes of Newer Dolerite. These authors also believe that the Mayurbhanj iron formation is older than the Iron-ore Series of Keonjhar-Bonai and that the sequence found to the north of the Singhbhum Copper Belt shear is younger than the Iron-ore Series as it is the same as, and continuous with, that in the Dhanjori syncline.

The sequence in north Singhbhum and in Dhanjori and Mayurbhanj may now be given as below:

Romapahari (Mayurbhanj), Kuilipal (Dhanjori) and Arkasani Soda-Granite (shear zone), all

Syntectonic

“Dhanjori orogeny” (Singhbhum orogeny of Sarkar and Saha)

Pyroxene granite-granophyre

Gabbro-anorthosite (V magnetite in places)

Spilitic Lavas and quartzite (Dhanjori and Dalma Lavas)

Turbidite sequence with quartz-conglomerate

Black phyllite

Conglomerate

-----Unconformity-----

Singhbhum Granite, mostly syntectonic

“Singhbhum orogeny” and folding of Iron-ore Series (-Iron-ore Orogeny of Sarkar and Saha)

Iron-ore Series of S. Singhbhum -Keonjhar-Bonai

Sarkar and Saha called the mountain building movements which followed the deposition of Iron-ore Series and which was accompanied by the intrusion of the Singhbhum Granite as “Iron-ore Orogeny”. It would most appropriately be called the SINGHBHUN OROGENY, particularly as Iyengar

and Alwar have now designated the one following the Dhanjori-Dalma assemblage of rocks as DHANJORI OROGENY.

Intrusive into the Iron-ore Series are ultramafic rocks, the Chota Nagpur Granite-Gneiss, Singhbhum Granite, the Arkasani Soda granite and dykes of Newar Dolerite.

Ultramafic Rocks.—In South Singhbhum there is a patch of altered peridotitic rock near Nurda which may be pre-Singhbhum in age. To the same age may belong the chromite bearing rocks (saxonite, Iherzolite etc.) found near Chaibasa. The chromite bodies in them have been worked for nearly 50 years.

The gabbro-anorthosites associated with lenses of vanadiferous magnetite in East Singhbhum and the pyroxene-rich beekite-granite-granophyre of Simlipal in Mayurbhanj belong to the period of development of marginal fractures along the Dhanjori geosyncline, prior to the Dhanjori Orogeny and the emplacement of the Romapahari and Kuilipal Granites. These granites appear to be a later age, probably contemporaneous with the formation of the shear zone and its mineralization by copper and uranium bearing fluids

The Chota Nagpur Granite-gneiss occupies an immense tract to the north of the Dharwarian rocks of Singhbhum and Gangpur. The northern belt of this extends from Santhal Parganas through Hazaribagh to Palamau and the southern one from Bankura to Ranchi and Jashpur and farther west. It is distinctly intrusive into the Iron-ore Series and assumes a banded and composite aspect near the margins of the schistose rocks, as for example along the Gangpur-Ranchi border. It is generally coarse and porphyritic and contains quartz, microcline orthoclase, oligoclase, biotite, a little apatite (and occasionally some green hornblende, in Singhbhum).Tourmaline is

frequently seen but especially abundant in the pegmatite phase as in Southern Ranchi. In parts of Manbhum, Ranchi and Hazaribagh, it weathers into tors and is called the Dome Gneiss. The composite form of the rock used to be referred to as the Bengal Gneiss in earlier geological literature. Its later phases are pegmatites, aplites and quartz veins, the last being often auriferous in Chota Nagpur.

Singhbhum Granite.-This great batholithic mass occupies an area of several hundred sq. km. in Singhbhum, Keonjhar and Mayurbhanj from Chaibasa in the north and to beyond Keonjhar in the south. According to A. K. Saha, who has made a detailed study of the northern part of this mass, it consists of a series of domed up intrusions varying in composition from biotite-granodiorite to adamellite, biotite-trondjemite and leucogranite. The margins are hornblende, chloritic or epidotic granodiorites and pyroxene-diorites derived by the granitisation of the country rocks. The main mass shows distinct N.-S. or N.N.W.-S.S.E. foliation which tends to become parallel to the margin of the country rocks. A few patches unassimilated older basic rocks and quartzites occur in the granite. The common granodiorite consists of perthitic microcline (20 to 30 per cent Ab.) with oligoclase-andesine (12 to 28 per cent An.), Quartz, biotite, subordinate muscovite and chlorite. The accessory minerals are epidote, sphene, zircon, apatite and rutile. The marginal structures have been controlled by the country rocks, while the central portions show evidences of forceful intrusion. The granite is traversed by numerous dykes of NEWER DOLERITE. Iyenger and Alwar believe that the granite, especially near its eastern margin, may contain younger intrusive units belonging to the Dhanjori orogeny which appears to be contemporaneous with the Satpura orogeny of the Bihar Mica Belt (950-1000 M.Y.) associated with intrusion of granite and mica bearing pegmatites.

The Arkasani Soda-granite—This rock, which is granophyric in part, is found along the thrust zone of the Copper Belt in several places. It varies from a feldspathic schist to a fairly coarse-grained granite, the former often showing thin bands and streaks of mafic minerals. Granophyric texture is

fairly common in some exposures. The typical rock contains partly altered plagioclase, quartz, muscovite, biotite and grains of magnetite and apatite. Sericitisation make up the epidotisation of the feldspars is common. The first two minerals make up the bulk of the rock. It is regarded as having been formed from the granitization and replacement of muscovite-quartz-schists which originally occupied much of the thrust zone. Radiometric dating seems to show that it is approximately of the same age as the mica bearing pegmatites of Bihar (about 950 M.Y.)

Mineral welth:

Other than ordinary stone & Sand a great variety of major mineral potential like Coal, Iron Ore, Manganese, Bauxite, Limestone and Specified Minor Minerals like Dolomite, Quartz, Pyroxenite & Decorative Stone (Granite) are available in the district.

Reserve & Resource potential Evaluation;

As per UNFC (*United Nations Framework Classification*) of potentials of minerals , A '**Mineral Reserve**' is the economically mineable part of a Measured and/or Indicated Mineral Resource. It includes diluting materials and allowances for losses which may occur when the material is mined. Appropriate assessments, which may include feasibility studies, have been carried out, and include consideration of, and modification by, realistically assumed mining, metallurgical, economic, marketing, legal, environmental, social and governmental factors. These assessments demonstrate at the time of reporting that extraction is justified.

The mineability (Economic Viability) is demonstrated in consecutive Feasibility Assessment stages which may be, in order of increasing detail, Prefeasibility Study and Feasibility Study/Mining Report. A Probable Mineral Reserve may derive from a Prefeasibility study and a Proved Mineral Reserve from a Feasibility Study or mining activity documentation. Hence for the Reserve Potential estimation of the Sundargarh district, the approved Mining Plans of each existing Quarry has been referred as it provides a details of the Mineable & Geological Reserve potentials of the Quarry lease.

As per the approved Mining Plans of the Quarry leases in Sundargarh District the Total mineral potential are as follows;

Potential Reserve as per Approved Mining plan of Sources of Sand

Sl No.	Name of Tahasil	Name and location of Source	Geological reserve as per approved Mining Plan of existing quarries (in m ³)	Mineable reserve as per approved Mining Plan of existing quarries (in m ³)

Similarly, as per UNFC (*United Nations Framework Classification*) of potentials of minerals A '**Mineral Resource**' is a concentration or occurrence of material of intrinsic economic interest in or on the Earth's crust in such form, quality and quantity that these are reasonable prospects for eventual economic extraction. The location, quantity, grade, geological characteristics and continuity of a Mineral Resource are known, estimated or interpreted from specific geological evidence and knowledge.

The resource figures are quoted as being of intrinsic economic interest, depending on the results of a Prefeasibility Study and feasibility Study.

Generally, only in-situ resource figures are reported at this stage of geological assessment. Mineral Resources are subdivided, in order of increasing geological confidence, into inferred, indicated and measured categories. Portions of a deposit that do not have reasonable prospects for eventual economic extraction must not be included in a Mineral Resource.

For assessment of potential resources of *New sairat sources of Sand*, a joint field survey has been done and sources has been identified. At this stage of survey, a detail study of each source is not feasible, hence the sand area of proposed quarry lease has been multiplied with the average sand bed thickness of the respective source to obtain the Geological resources whereas for Mineable resources has been considered about 60% of geological Resources **(Table No. 11.A.03)**.

As in nature the replenishment of sand is a natural process within the river bed, But the estimated potential may vary in each successive year.

(a) District wise details of river or stream and other sand source;

Annexure-I

In Sundargarh District River beds and streams are the only source of Sand, hence the details of the main river and streams are given in the following table as per the data provided by irrigation department:

Drainage system with description of main river (Table No. 11.A.01)

Sl No.	Name of the River	Area Drained (Sq.Km)	% Area Drained in the District
1	IB	7623.00	38.16
2	Madalghat Nallah Sukhajore	27.00	100.00
3	Safai	1102.25	100.00
4	Ustalli Nallah	50.00	100.00
5	Gahirajore Nallah	45.00	100.00
6	Sarswati Nallah	26.00	100.00
7	Ichha	400.00	100.00
8	Sankha	10835.00	12.69
9	Koel	12230.00	9.57
10	Badjore Nallah (Sankh)	35.00	100.00
11	Deo Nallah	132.00	31.50
12	Brahamani River	26190.00	11.93
13	Siudhi Nallah	18.50	100.00
14	Kuradi Nallah	32.00	100.00

(Table No. 11.A.03)

Main river streams in Sundargarh district are Brahmani River, Ib River, etc, rest all streams like sankha, koel etc. are tributaries of these rivers. Details of the proposed sources are as Follows,

S. No.	River or Stream	Portion of the river or stream recommended for mineral concession	Length of area recommended for mineral concession (in kilometer)	Average width of area recommended for mineral concession (in meters)	Area recommended for mineral concession (in square meter)	Mineable mineral potential (in m ³) (60% of total mineral potential)
